## Final Exam

### Final: Question 4

---

[Back to the Question](#)

#### Correct Answers

- You cannot specify the same host information among multiple members.

Host information must be unique for each member in a replica set.

- You cannot specify two members with the same `_id`.

`_id` must be unique for each member in a replica set.

#### Incorrect Answers

- You can only specify a **priority** of 0 or 1, member "`_id`": 0 is incorrectly configured.

Replica set members can have priority greater than 1, and this will increase the likelihood that a member becomes primary during an election (however, it cannot guarantee a node will become primary).

- You cannot have three members in a replica set.

Replica sets can have any number of members, although an odd number is recommended.
