Chapter 1: Basic Aggregation - \$match and \$project

Lab - Changing Document Shape with \$project

Problem:

Our first movie night was a success. Unfortunately, our ISP called to let us know we're close to our bandwidth quota, but we need another movie recommendation!

Using the same **\$match** stage from the previous lab, add a **\$project** stage to only display the the title and film rating (**title** and **rated** fields).

- Assign the results to a variable called **pipeline**.

```
var pipeline = [{ $match: { . . . } }, { $project: { . . . } }]
```

COPY

- Load **validateLab2.js** which was included in the same handout as **validateLab1.js** and execute **validateLab2(pipeline)?**

```
load('./validateLab2.js')
```

COPY

- And run the `validateLab2` validation method

```
validateLab2(pipeline)
```
