## Chapter 1: Introduction

### Lab 1.1: Install Course Dependencies

#### Problem:

Welcome to your first lab in M201! In this lab you're going to install MongoDB Enterprise 3.4 and import the **people** dataset.

You can download the **people.json** dataset from this lesson.

While MongoDB Enterprise is available as part of the MongoDB Enterprise Advanced subscription it's permitted to be run outside of production environments.

In order to install MongoDB you're going to need to head over to our online documentation and follow the [instructions on installing MongoDB](#).

After you've successfully installed MongoDB you should start a standalone server. Once your server is up and running you should be able to download the **people.json** handout and import it with **mongoimport**. Make sure to import the documents into the **m201** database and the **people** collection.

To confirm that you've successfully completed these steps run the following query on the **m201** database from the **mongo** shell and paste its output into the submission area below:

```
> db.people.count({ "email" : { "$exists": 1 } })
```

COPY

Attempts Remaining: **Correct Answer**

Enter answer here:

50474

Correct!
