## Chapter 4: CRUD Optimization

### Optimizing your CRUD Operations

---

#### Problem:

When building indexes to service your queries, which of the following is the general rule of thumb you should keep when ordering your index keys?

Note, use the following definitions to for this question:

- **equality**: indexed fields on which our queries will do equality matching
- **range**: indexed fields on which our queries will have a range condition
- **sort**: indexed fields on which our queries will sort on

Attempts Remaining: **Correct Answer**

Check all answers that apply:

☐ equality, range, sort

☐ sort, range, equality

☐ sort, equality, range

☒ equality, sort, range

☐ range, sort, equality

☐ range, equality, sort
