Final Exam

Final: Question 5

[< Back to the Question](#)

The correct answer is:

- It serves as a "hot" backup of data in case of accidental data loss on the other members, like a DBA accidentally dropping the database.

The node with "`_id`": 3 is delayed by 1 hour. So if a DBA drops a database, that database will be dropped from all secondary nodes *without* a delay, but it will still be present on the node with "`_id`": 3 for 1 hour.

All other answers are incorrect.
