Chapter 2: Replication

Lab - Read Concern and Read Preferences

[← Back to the Question](#)

The key concept to understand here is that when two nodes go down in a three-node replica set, the third node becomes a secondary regardless of whether it started as a primary.

Therefore, connecting to the third node is the same as connecting to a secondary node, and any **readPreference** will work except for **primary**, which requires all operations to read from the primary node.
