Chapter 2: Tooling Overview

\$indexStats, Part 5

[< Back to the Question](#)

The first thing to note is that the query uses the shard key, and that it uses just the index prefix. Next, we note that:

- "iPhone" is in shard s3
- "iPad" is in shard s3
- "Apple Watch" is in shard s1

Therefore, it'll be a targeted query, and will hit shards s1 and s3.

While it wasn't part of the question, it increments the `{name : 1, dateCreated : 1}` index on those shards.
