Final Exam

Final: Question 5

[Back to the Question](#)

Correct Answers:

Inserts of **doc1**, **doc2**, and **doc3** will succeed.

These writes do not conflict with each other, and they should all succeed if there are no network errors.

Incorrect Answers:

Inserts of **doc4** and **doc5** will not succeed.

doc4 has the same **_id** as **doc1**, and the server will throw a **duplicate key error** on this insert operation.

The default behavior for bulk writes is an *ordered* execution of the batch. So because the insert of **doc4** fails, the insert of **doc5** will not be executed.
