

Chapter 1: The Mongod

Lab - Importing a Dataset

[⏪ Back to the Question](#)

The import can be properly completed with the following command:

```
mongoimport --drop --port 27000 -u "m103-application-user" \  
-p "m103-application-pass" --authenticationDatabase "admin" \  
--db applicationData --collection products /dataset/products.json
```

COPY

We authenticate to the database the same way with **mongoimport** as we did with **mongo**. The flags **--db** and **--collection** are used to designate a target database and collection for our data. The flag **--drop** is used to drop the existing collection, so we don't create duplicates by running this command twice.
