Final Exam

Final: Question 3

< **Back to the Question**

The correct answer is **5**.

Because this is failover, the node that was primary is now unreachable. We can also see from the output that the member with `_id: 4` is also unreachable. That means 2 of the 7 nodes were unavailable, and that leaves us with 5 nodes eligible to become primary.

All other answers are incorrect. While the replica set is configured with 7 members, looking closely at the output we can see that one member is unreachable, specifically the member with `_id: 4`.
