Final Exam

Final: Question 2

< **Back to the Question**

The correct answers are the following:

- **Pipeline 1** is incorrect because you cannot use an accumulator expression on `$match` stage.

We cannot use accumulator expressions within `$match`. Only query expressions are allowed within `$match`

- **Pipeline 3** is correct and will execute with no error

This is correct. Although we may argue that `$ROOT` variable is totally unnecessary, since `_id` field will be projected by default from the first `$project` stage of this pipeline, there are no observable errors with the use of this expression variable

- **Pipeline 2** fails because `$divide` operator only supports numeric types

This is true, `$divide` operator will only supports expressions that represent numeric value types.

All the other statements are not true.
